How does useEffect() work?	The useEffect() hook tells React that your component needs to do something after render. React will remember the function you passed (we'll refer to it as our "effect"), and call it later after performing the DOM updates.
What does the static keyword in a function mean?	Static members belongs to the class, rather than a specific instance. This means that only one instance of a static member exists, even if you create multiple objects of the class, or if you don't create any. It will be shared by all objects.
What does the 'finally' block in Python do?	'Finally' defines a block of code to run when the try... except...else block is final. The finally block will be executed no matter if the try block raises an error or not.
